DOWN REGULATES BETA-CATENIN. PROBABLY FACILITATE THE PHOSPHORYLATION OF BETA-CATENIN AND APC BY GSK-3B (BY SIMILARITY).

-!- SUBUNTT: INPERACTS WITH GSK-3B AND BETA-CATENIN. THE INTERACTION BETWEEN AXIN AND BETA-CATENIN OCCURS VIA THE ARMADILLO REPEATS CONTAINED IN BETA-CATENIN. TERNARY COMPLEX. ALSO BINDS TO PLAKOGLOBIN (GAMMA-CATENIN). APC, DVL AND PP2A (BY SIMILARITY).

-!- SUBCELLULAR LOCATION: CYTOPLASMIC (BY SIMILARITY).

-!- ALTERNATIVE PRODUCTS: 2 ISOFORMS; 1 (SHOWN HERE) AND 2; ARE PRODUCED BY ALTERNATIVE SPLICING.

-!- FIRSUE SPECIFICITY: EXPRESSED IN EMBRYONIC STEM CELLS.

-!- DEVELOPMENTAL STAGE: WIDELY EXPRESSED AT E10.5 TO E16.5 DAY.

-!- PTM: PROBABLY PHOSPHORYLATED BY GSK-3B AND DEPHOSPHORYLATED BY

```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Detecting the presence or amount of conductin, at protein or nucleic acid levels, is used to diagnose tumours, while agents that (re)activate conductin are used for tumour therapy. Conductin binds to beta-catenin and induces its cytoplasmic degradation, resulting in blockade of the Wnt/Wlingless signalling pathway in vertebrates. Conductin also binds to Adenomatous Polyposis Coli (APC) fragments and, in conjunction with APC, acts as a tumour suppressor.
                        Tumor-suppressing protein conductin
               diagnosis of tumors

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ₽
Nucleic acids encoding mutant and wild type Axin and coligonucleotides derived from them are useful for detecting mutations in the Axin gene and for determining whether a subject is likely to develop cancer (including breast, colorectal, gastrointestinal, esophageal, carcinomas or melanomas). The wild type Axin and homologues of Axin are useful for treating subjects who are likely to develop cancer (thyroid carcinomas). The nucleic acids are also useful for diagnosing cancer and for detecting mutations in cancerous cells. Wild type Axin, its antisense molecule and identified compounds form pharmaceutical compositions in the treatment of cancer. The compositions are also useful for treating cancer by inhibiting tumorigenesis (by inducing degradation of beta-catenin). The nucleic acid encoding Axin acts through
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     anti-tumour activity. Detecting the presence or amount of conductin, at protein or nucleic acid levels, is used to diagnose tumours, while agents that (re)activate conductin are used for tumour therapy. Conductin binds to beta-catenin and induces its cytoplasmic degradation, resulting in blockade of the Wnt/Wingless signalling pathway in vertebrates. Conductin also binds to Adenomatous Polyposis Coli (APC) fragments and, in conjunction with APC, acts as a tumour suppressor.
                                                                                                                                                                                                                       Claim 8;

                                                                                        likely to develop cancer (including breast, colorectal, gastrointestinal, esophageal, carcinomas or melanomas). The wild type Axin and homologues of Axin are useful for treating subjects who are likely to develop cancer (thyroid carcinomas). The nucleic acids are also useful for diagnosing cancer and for detecting mutations in cancerous cells. Wild type Axin, its antisense molecule and identified compounds form pharmaceutical compositions in the treatment of cancer. The compositions are also useful for treating cancer by inhibiting tumorigenesis (by inducing degradation of beta-catenin). The nucleic acid encoding Axin acts through negative regulation of the Wnt pathway in the Nieuwkoop Center.
                                                                                                                                                                                                                                             Nucleic acids encoding mutant and wild type Axin and oligonucleotides derived from them are useful for detecting mutations in the Axin gene and for determining whether a subject is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Axin; cancer; breast cancer; colorectal cancer;

밁
                               E. colony transformants contg. Candida antarctica lipase A, chromosomal DNA of the C. antarctica strain LF058 (DSM 3855) were C prepd. The colonies are screened with the 32P-phosphorylated oligo C degenerate probe NOR 440, based on the N-terminal sequence determined from mature C. antarctica lipase. Plasmids were prepd. C from positive colonies and analysed by southern hybridisation. The probe for the southern is either the NOR 440 probe or a 32P-labelled probe NOR438. NOR 438 is an oligo corresp. to AA C sequence of the lipase in which, at 13 posms. a base has been chosen on the basis of codons used in yeasts and filamentous fungi. (Guess positions are indicated in 094949 FT). Only one plasmid, pMT1076, contains a band which hybridises both to NOR 440 c plasmid, pMT1076, contains a band which hybridises both to NOR 440 c plasmid, pMT1076, contains a band which hybridises both to NOR 440 c last two AAs of the propeptide (see R78230) are a typical c cleavage site for endoproteolytic processing by enzymes of the S.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Key
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Candida antarctica DSM 3855
                                                                                                                                                                                                                                                                                                                  Aspergillus japonicus-type cells expressing heterologous protein - esp. fungal enzyme, provide high yields without significant prodn. of protease

                                                                                                                                                                                                                                   This sequence represents the C. antartica lipase A protein. This lipase has high thermostability and is active at acid pH. A varient of the mature lipase A in which Phel39 has been replaced by a Trp residue has increased specific activity compared to the parent lipase. The lipase or varient may be used in ester hydrolysis, ester synthesis or interesterification. They can also be used for avoiding pitch trouble in the process for the production of mechanical pulp or a paper-making process using mechanical pulp. They can also be used in detergents or as a digestive enzyme, eg. in the treatment of cystic fibrosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Lipase A; thermostability; specific activity; mechanical ester hydrolysis; ester synthesis; interesterification; epitch; paper-making; detergent; digestive enzyme; cystic

This sequence represents the Lactococcus lactis HsdR subunit. Nucleic acids encoding the HsdR, HsdM or HsdS fragment can be used for expression of at least one bacteriophage resistance mechanism in a lactic acid bacterium.

The polypeptide was identified in a database search for putative calcium channel proteins. The c05c12.3 protein was noteable cause its central pore region had some similarity to, but was clearly distinct from, members of the Trp family of calcium chennels. The polypeptide was used in BLAST screening to isolate 2 other C. elegans homologues (see

  Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                            272
